1 Data Collection

The first thing we need to consider after model translation is data collection. For the supply of components are infinite, the input I formulate here is **the output of two inspectors**. There are five channels output of two inspectors and three kinds of components totally. So I extract data from Inspector's inspection time for components. Each data point represents the time of a specific component processed. I identify the distributions of each set of data using histograms. Below is what I draw by using python matplotlib library.

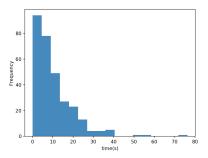

Figure 1: Data collection of Component1 from Inspector1

2 Q-Q plots

The construction of histograms are necessary ingredients for choosing a family of distribution but it's not as useful to evaluate the fit of chosen distribution. Quantile-quantile plot is a useful tool for evaluating distribution fit.

First let $\{x_i, i=1,2,...,n\}$ be sampled data and sort the from the smallest to the largest $\{y_j, j=1,2,...,n\}$. The q-q plot is based on that y_i is an estimate of the (j-1/2)/n quantile of sampled data. I set $\sqrt{300}=18$ bins totally.

Try some different kinds of common distribution and I found exponential distribution fits the most. Below I choose exponential distribution as the family.

3 Chi-Square Test

3.1 Component1 from Inspector1

The following hypotheses are formed;

 H_0 : The random variable is exponential distributed. H_1 : The random variable is not exponential distributed.

the pmf for exponential distribution is given:

$$p(x) = \begin{cases} \lambda e^{-\lambda e}, x \ge 0\\ 0, x < 0 \end{cases}$$
 (1)

We assume that $\hat{\lambda} = \frac{1}{\bar{X}} = 0.097$

Table 1: Chi-Square Goodness-of-Fit Test

| $\overline{x_i}$ | Class Interval | ObservedFrequency | ExpectedFrequency | $\frac{(O_i - E_i)^2}{E_i}$ |
|------------------|--------------------|-------------------|-------------------|-----------------------------|
| 0 | [0, 0.4238) | 87 | 100.74 | 1.87 |
| 1 | [4.238, 8.476) | 79 | 66.91 | 2.18 |
| 2 | [8.476, 12.714) | 46 | 44.44 | 0.05 |
| 3 | [12.714, 16.952) | 34 | 29.52 | 0.68 |
| 4 | [16.952, 21.19) | 19 | 19.61 | 0.02 |
| 5 | [21.19, 25.428) | 16 | 13.02 | 0.68 |
| 6 | [25.428, 29.666) | 7 | 8.65 | 0.31 |
| 7 | [29.666, 33.904) | 4 | 5.75 | 0.53 |
| 8 | [33.904, 38.142) | 4 | 3.82 | 0.01 |
| 9 | [38.142, 42.38) | 1 | 2.53 | 0.93 |
| 10 | [42.38, 46.618) | 0 | 1.68 | 1.68 |
| 11 | [46.618, 50.856) | 0 | 1.12 | 1.12 |
| 12 | [50.856, 55.094) | 1 | 0.74 | 0.09 |
| 13 | [55.094, 59.332) | 1 | 0.49 | 0.52 |
| 14 | [59.332, 63.57) | 0 | 0.33 | 0.33 |
| 15 | [63.57, 67.808) | 0 | 0.22 | 0.22 |
| 16 | [67.808, 72.046) | 0 | 0.14 | 0.14 |
| 17 | [72.046, 76.284] | 1 | 0.10 | 8.51 |
| 18 | $(76.284, \infty)$ | 0 | 0.19 | 0.19 |
| Total | | 300 | 300 | 20.08 |

We have 18 bins and the freedom degree should be 18-1-1=16. Using a significance level of 0.05 and check the table, we find that $\chi^2_{0.05,16} = 26.3 > 20.09$. So we can't reject that the input follows exponential distribution.

3.2 Component2 from Inspector2

We assume that $\hat{\lambda} = \frac{1}{\bar{X}} = 0.097$

Table 2: Chi-Square Goodness-of-Fit Test

| $\overline{x_i}$ | Class Interval | ObservedFrequency | ExpectedFrequency | $\frac{(O_i - E_i)^2}{E_i}$ |
|------------------|---------------------|-------------------|-------------------|-----------------------------|
| 0 | [0, 6.357) | 87 | 100.74 | 1.87 |
| 1 | [6.357, 12.714) | 79 | 66.91 | 2.18 |
| 2 | [12.714, 19.071) | 46 | 44.44 | 0.05 |
| 3 | [19.071, 25.428) | 34 | 29.52 | 0.68 |
| 4 | [25.428, 31.785) | 19 | 19.61 | 0.02 |
| 5 | [31.785, 38.142) | 16 | 13.02 | 0.68 |
| 6 | [38.142, 44.499) | 7 | 8.65 | 0.31 |
| 7 | [44.499, 50.856) | 4 | 5.75 | 0.53 |
| 8 | [50.856, 57.213) | 4 | 3.82 | 0.01 |
| 9 | [57.213, 63.57) | 1 | 2.53 | 0.93 |
| 10 | [63.57, 69.927) | 0 | 1.68 | 1.68 |
| 11 | [69.927, 76.284) | 0 | 1.12 | 1.12 |
| 12 | [76.284, 82.641) | 1 | 0.74 | 0.09 |
| 13 | [82.641, 88.998) | 1 | 0.49 | 0.52 |
| 14 | [88.998, 95.355) | 0 | 0.33 | 0.33 |
| 15 | [95.355, 101.712) | 0 | 0.22 | 0.22 |
| 16 | [101.712, 108.069) | 0 | 0.14 | 0.14 |
| 17 | [108.069, 114.426) | 1 | 0.10 | 8.51 |
| 18 | $(114.426, \infty)$ | 0 | 0.19 | 0.19 |
| Total | | 300 | 300 | 20.08 |

We have 18 bins and the freedom degree should be 18-1-1=16. Using a significance level of 0.05 and check the table, we find that $\chi^2_{0.05,16} = 26.3 >$ 20.06. So we can't reject that the input follows exponential distribution.

Component3 from Inspector2 3.3

We assume that $\hat{\lambda}=\frac{1}{\bar{X}}=0.048$ We have 18 bins and the freedom degree should be 18-1-1=16. Using a significance level of 0.05 and check the table, we find that $\chi^2_{0.05,16} = 26.3 > 24.8$. So we can't reject that the input follows exponential distribution.

Workstation1 3.4

We assume that $\hat{\lambda}=\frac{1}{\bar{X}}=0.217$ We have 18 bins and the freedom degree should be 18-1-1=16. Using a significance level of 0.05 and check the table, we find that $\chi^2_{0.05,16} = 26.3 >$

Table 3: Chi-Square Goodness-of-Fit Test

| x_i | Class Interval | Observed Frequency | Expected Frequency | $\frac{(O_i-E_i)^2}{E_i}$ |
|-------|----------------------|--------------------|--------------------|---------------------------|
| 0 | [0, 5.7788) | 70 | 73.28 | 0.15 |
